

Task 1: Hydraulic Fluid System

1. Create the hydraulic fluid system described in figure 1.

After completing the block diagram perform the following modifications.

2. Modify the “Displacement” within the Displacement Pump to $5\text{e-}4 \text{ m}^3/\text{rev}$.
3. Within the 4-way directional valve under the “Basic Parameters” tab change the parameter to reflect as they do in figure 2.

Settings

Basic Parameters | Model Parameterization | Valve Opening Offsets

Area characteristics: Identical for all flow paths

Model parameterization: Maximum area and opening

Leakage area:

Flow discharge coefficient:

Laminar transition specification: Reynolds number

Critical Reynolds number:

Figure 2: 4-Way Directional Valve Parameters

4. Within the 4-way directional valve under the “Model Parameterization” tab change the following as shown in Figure 3:
 - a. Maximum Opening: 0.005 m
 - b. Maximum Opening Area: $5\text{e-}4 \text{ m}^2$

Settings

Basic Parameters | Model Parameterization | Valve Opening Offsets

Maximum opening:

Maximum opening area:

Figure 3: 4-Way Directional Valve Parameters

5. Within the “Double Acting Hydraulic Cylinder” change the following as shown in Figure 4 below:
 - a. Piston area A: 0.125 m^2
 - b. Piston area B: 0.125 m^2
 - c. Piston Stroke: 0.5 m

Settings

Basic parameters Hard stop properties Initial conditions

Piston area A: 0.125 m²

Piston area B: 0.125 m²

Piston stroke: 0.5 m

Dead volume A: 1e-4 m³

Dead volume B: 1e-4 m³

Specific heat ratio: 1.4

Cylinder orientation: Pressure at A causes positive displacement of R relative to C

Figure 4: Double Acting Hydraulic Cylinder Parameters

6. On the “Hard stop properties” ensure the parameters reflect as shown in figure 5

Settings

Basic parameters Hard stop properties Initial conditions

Contact stiffness: 1e9 N/m

Contact damping: 150 N/(m/s)

Hard stop model: Full stiffness and damping applied at bounds, damped rebound

Figure 5: Double Acting Hydraulic Cylinder Parameters

7. Within the “Pressure Relief Valve” ensure the parameters reflect as shown in figure 6.

Settings

Parameters

Opening area parameterization: Linear area-pressure relationship

Maximum passage area: 2e-4 m²

Valve pressure setting: 3e7 Pa

Valve regulation range: 3e6 Pa

Flow discharge coefficient: 0.7

Leakage area: 1e-12 m²

Laminar transition specification: Reynolds number

Critical Reynolds number: 12

Opening dynamics: Do not include valve opening dynamics

Figure 6: Pressure Relief Valve Parameters

8. Change the translational spring stiffness to 1000 N/m
9. Change the translational damper damping rate to 100 N/m/s
10. Mass to 100 kg
11. Within the “PS Constant” block, change the constant value to 188 rad/s
12. Within the “Simulink-PS Converter” block connecting the “Sine Wave” and the “4-way Directional Valve”, change the “Input Signal Unit” to meters, as shown in figure 7.

Parameters

Units Input Handling

Input signal unit: m

☐ Apply affine conversion

Figure 7: Simulink-PS Converter Unit Parameter

13. Open the “Sine Wave” block and make the amplitude 0.003
14. Within the “Hydraulic Fluid” change the Hydraulic Fluid to Skydrol LD-4

15. Enable Simscape Logging by going to Simulation → Model configuration parameters → Simscape Pane → data logging section → select all.
16. **Uncheck** Limit data points as shown in Figure 8.

Figure 8: Data-Logging Setup

17. After making the changes, run the simulation.
18. Within the “Review Results” section in the “Simulation” ribbon tab, click on the “Simscape Results” button as seen in figure 9.

Figure 9: Simscape Results

19. In the left-hand pane, click on the “Translational Spring”. In the main window, 3 stacked plots showing the input force, the velocity, and the displacement to the translational spring will display, as shown in figure 10.

Figure 10: Data Inspector Layout

NOTE: Alternatively, to step 15, you can right click on the “Translational Spring” and select Simscape → View Simulation Data → Simlog to quickly view the Simscape results. Figure 11 illustrates this selection.

NOTE: To view changes to the system, you will need to reload the data within the “Simscape Results Explorer” after each simulation run. To view the effects of changes to the system simulation, click on the “Reload Logged Data” button or by closing the “Simscape Results Explorer” window and re-opening it.

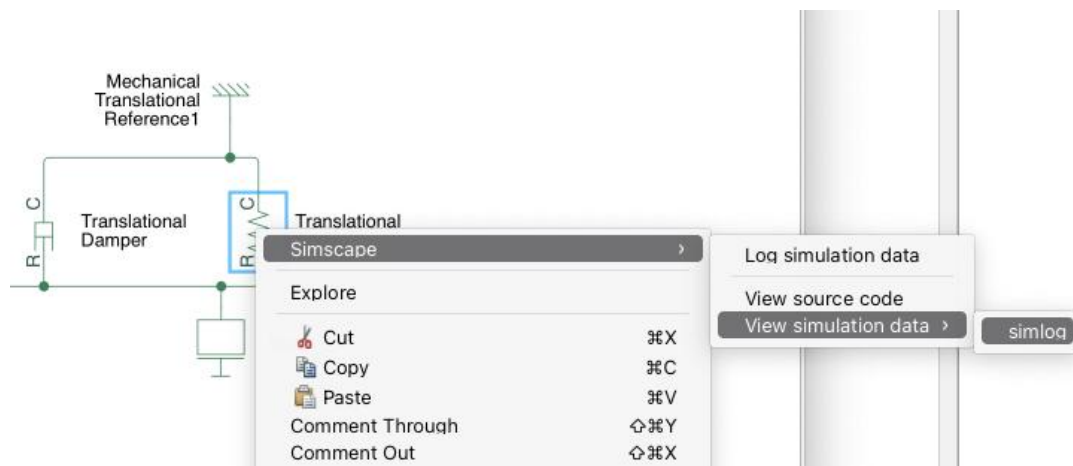

Figure 11: View Simlog

To show completion of this task, take a screenshot of all three plots together and show the TA.

Post-Lab Questions

1. Adjust the displacement of the system in a way that will match the output as shown below. What value of displacement did you find that re-produced the plot? Show your plot.

2. Briefly describe how the displacement of the displacement pump affects a hydraulic fluid system.
3. Briefly describe what a 4-way directional valve is for a hydraulic fluid system.
